## C# GUI Student Management System

Develop a simple C# Windows Forms Student Management System consisting of four connected screens.

The application is for simulation purposes only, for now. No database or data-sharing functionality is required.

### 1. Login Screen

Design a Login screen containing:

- Username TextBox
- Password TextBox
- Login Button

For simulation purposes, use the following login details:

Username: admin

Password: 1234

When the user clicks Login:

- If the username and password are correct, the Dashboard must open.
- The Login screen must be hidden.
- If the details are incorrect, display an appropriate error message.

### 2. Dashboard Screen

Design a Dashboard containing:

- Welcome message
- Student Details button
- Student Summary button
- Logout button

The buttons must perform the following actions:

| Button          | Action                               |
|-----------------|--------------------------------------|
| Student Details | Opens the Student Details screen     |
| Student Summary | Opens the Student Summary screen     |
| Logout          | Returns the user to the Login screen |

### 3. Student Details Screen

Design a form where the user can enter:

# Practical – 01 October 2026

- Student Name
- Student Number
- Course
- Age

Include:

- Save button
- Back button

When the user clicks Save, display a message confirming that the student information has been saved.

**The information does not need to be stored or shared with another form.**

The Back button must return the user to the Dashboard.

## 4. Student Summary Screen

Design a Student Summary screen that contains areas for displaying:

- Student Name
- Student Number
- Course
- Age

For this task, the summary screen is for GUI simulation purposes only. The information does not need to be retrieved from the Student Details screen.

Include a Back button that returns the user to the Dashboard.

## 5. Application Navigation and Functionality

The application must demonstrate:

- Navigation between the four forms.
- Working button events.
- Login validation.
- Appropriate use of controls.
- Appropriate names for forms and controls.
- A consistent and user-friendly GUI design.

Add your project as a repository to the CTU-SD2-Projects-2026 organisation.

Go to the Issues section of your repository and create an issue that mentions @newmanblessing. The issue must contain the following message:

Hi @newmanblessing, I am done.
